INTRODUCTION

The 1981 Vital Statistics Annual Summary continues the practice, begun in 1980, of presenting a data analysis section along with the tabular summary of vital events. This analysis is not intended to be sophisticated or exhaustive; instead it represents an attempt to look at vital statistics data in new ways which may stimulate further analyses by those involved in health planning and program evaluation in the state. In addition, the data analysis section presents new results of data quality studies, which will be of interest to those using the data. The authors welcome any questions or comments about the material presented herein, or suggestions for future analysis.

This report contains a summary presentation, in tabular form, of the vital events which occurred during the calendar year 1981. In the interest of easy comparison, the same format of tabular presentation has been continued as was initiated in the 1968-69 edition.

New to the summary this year is Table 3 - Livebirth Inter-County Travel Patterns, a cross tabulation of residence and occurrence livebirths. This table will be included in future editions of the summary.

Population data are the official 1981 estimates for the State of Washington as prepared by the Office of Financial Management.

STATE OF WASHINGTON

1981 IN BRIEF

BIRTH

The birth rate for 1981 remains unchanged from the 1980 rate of 16.4 per 1,000 population. Twenty years ago, in 1962, of 64,812 total births to residents, 34,225 or 52.8% were to women aged 15-24 and 9,459 (14.6%) to women 19 and younger; while in 1981, of 69,756 births, 45.6% or 31,829 were to women 15-24 and 8,278 (11.9%) were to women under 20. In these same years, to women aged 25-34, there were 24,655 births (38% in 1962) and 34,714 (49.8% in 1981). In 1962, midwives certified two births compared to 1,007 in 1980, and 1,544 in 1981. Home births have also increased in occurrence from 192 (0.3%) in 1962 to 973 (1.4%) in 1981.

DEATH

The death rate has shown a decline over the last 20 years, from 9.3 per 1,000 population in 1962 to the 1981 low of 7.5. Particular causes of death do not reflect this decrease, however. Malignant neoplasms reached a high of 177.3 in 1977 and have since decreased to 166.2 in 1981, but this far exceeds the 1962 rate of 149.7. The suicide rate shows a dramatic increase over 1980, from 13.5 per 100,000 population to 15.1 in 1981. The death rate from all accidents has declined from 56.9 in 1962 to 43.7 in 1981.

INFANT DEATH

The infant death rate continued to decline, reaching a low of 10.5 per 1,000 live births in 1981. This rate is a full 54% reduction of the death rate of 22.8 twenty years ago.

MATERNAL DEATH

Continuing at 0.1 per 1,000 livebirths, the maternal death rate is unchanged from 1980. Although the number of maternal deaths increased four-fold, from 1 to 4, the statistical relationship to livebirths remained the same.

FETAL DEATH

There were 489 fetal deaths in 1981 compared to 533 in 1980, maintaining a consistent pattern of decline in the fetal death ratio to a low of 7.0 per 1,000 livebirths.

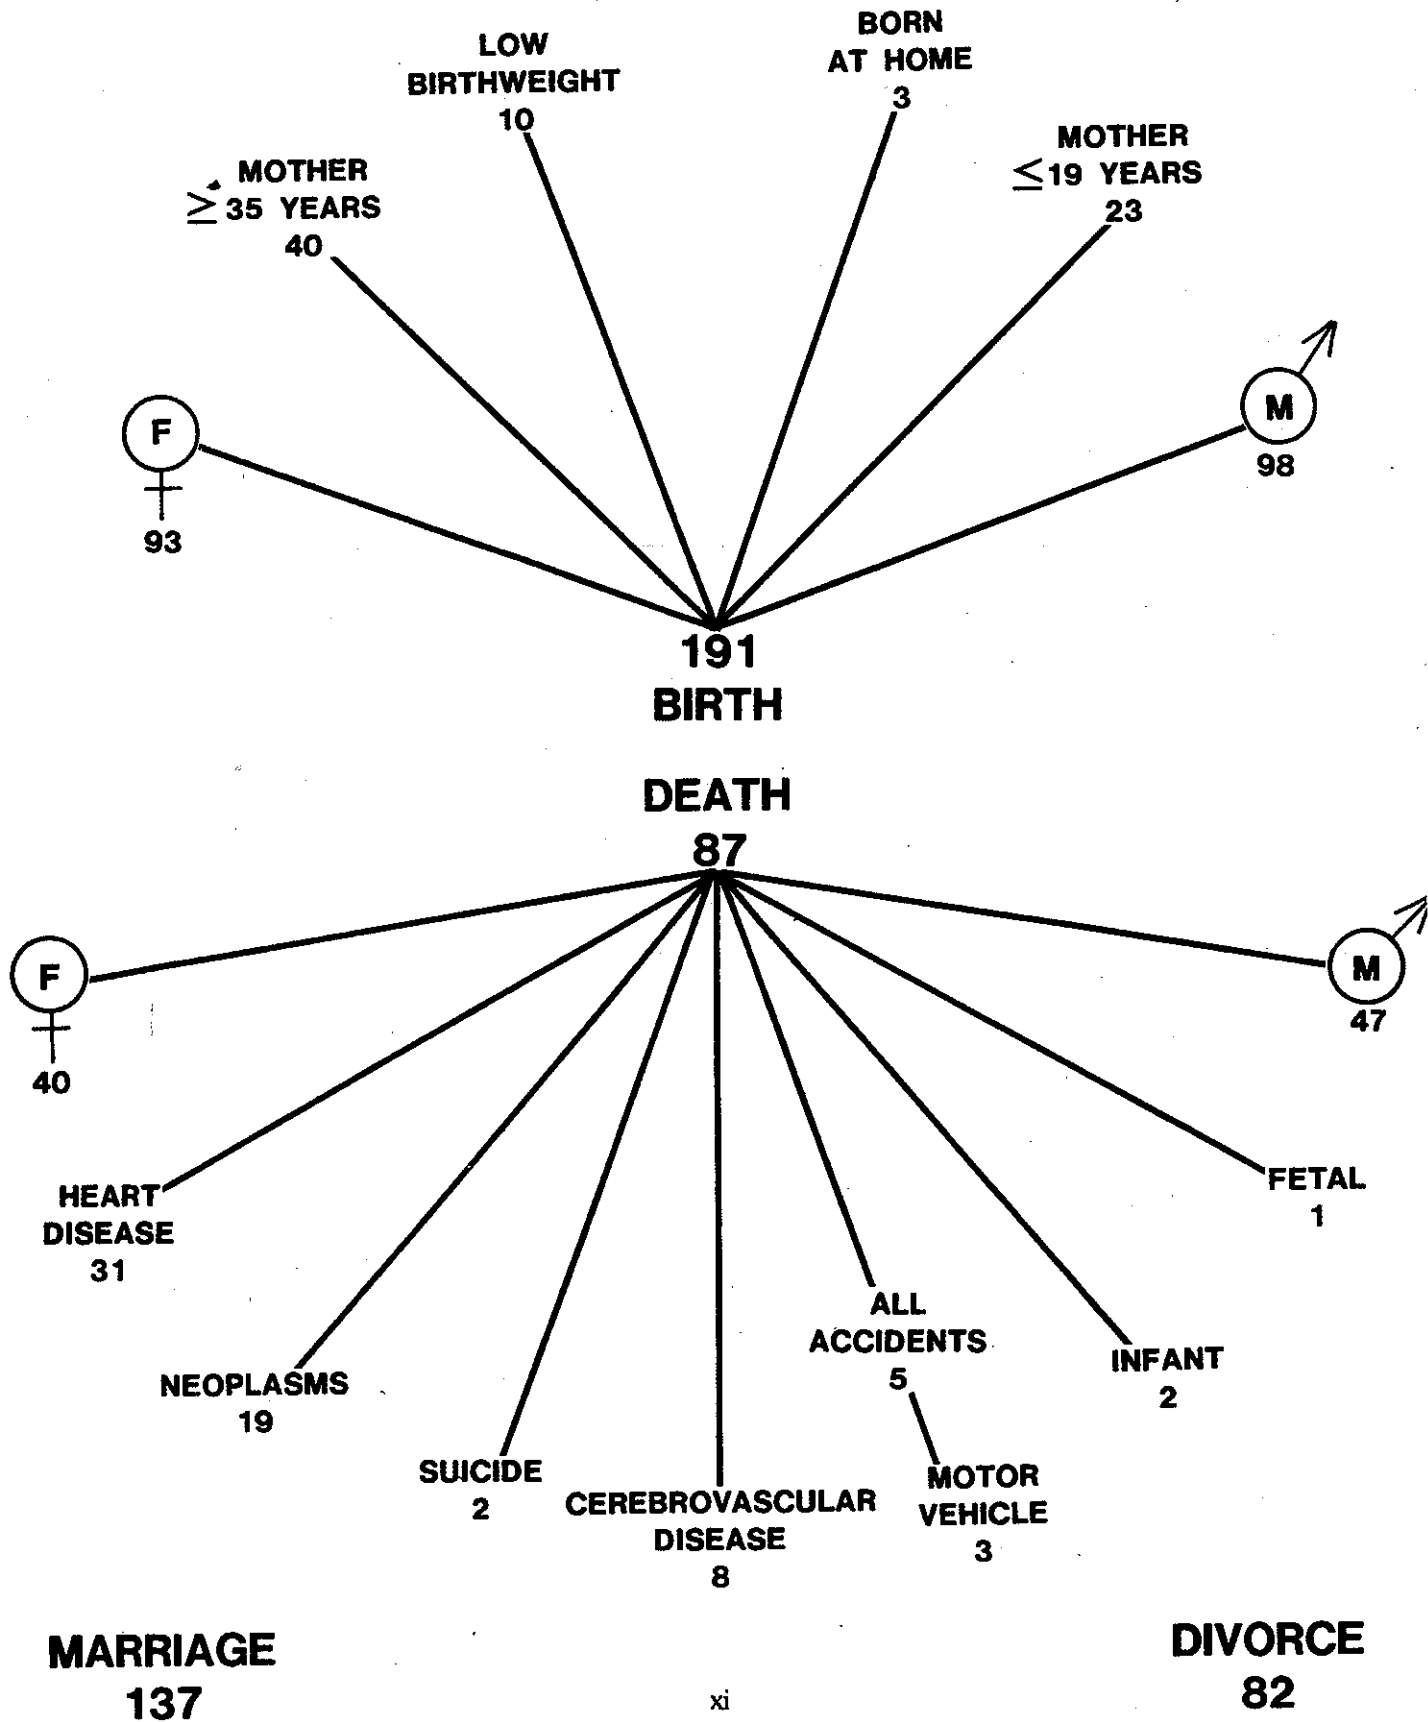

MARRIAGE

The number of marriages, 49,973, rose 4.7% from 47,728 in 1980, and 14.3% from 43,737 in 1977, five years ago. From 1980 to 1981, marriages to persons aged 10-14 increased 64.3% (from 14 to 23) and dropped 15.7% (465 to 392) for persons 70-74 years of age.

DIVORCE

Divorces totaling 29,511 rose 4.1% from 28,342 in 1980, and 11.4% from 26,483 in 1977.

DAILY EVENTS IN WASHINGTON STATE 1981

GENERAL OVERVIEW

DEATH RATES CONTINUE TO DECLINE

In 1981, Washington State residents had 69,756 births and 32,022 deaths; thus there were 2.2 births for each death. The birth rate remained at its 1980 level of 16.4 births/1,000 population, consistent with the fact that women in the childbearing years (aged 15-44) constituted 23.9 percent of the population in both 1980 and 1981.

Death rates continued to decrease, as they have for the past 40 years. Despite the fact that the proportion of the population aged 65 and older increased from 10.1 percent in 1980 to 10.5 percent in 1981, the death rate decreased by four percent, from 7.8 deaths/1,000 population in 1980 to 7.5 deaths/1,000 population in 1981. A larger change was found for fetal and infant death rates, each of which decreased by 11 percent.

These data show that, on the average, the health of Washington's population is continually improving, at least with respect to overall mortality. Individual causes of death will be examined in more detail in the mortality section of this summary.

BIRTH and DEATH RATES 1915-1981

INFANT and FETAL DEATH RATES 1915-1981

Washington Vital Statistics Summary, 1981

NATALITY

PRESENTED THIS YEAR--TRAVEL PATTERNS OF MOTHERS AND CONSISTENCY OF DATES

The important issue of travel by mothers to available services was addressed briefly in the 1980 Annual Summary, where data were presented in terms of inter-county travel. This year's analysis of travel patterns was approached from a different viewpoint--examining travel between cities or travel from outside a city into a city for delivery. This methodology eliminates the use of county lines as dividers when studying the state as a whole. However, because inter-county travel is important to local health department planning efforts, a table of county of residence by county of occurrence has been added to the natality tables of this summary.

The birth certificate collects data on several dates which are potentially useful to family planning and maternal and child health programs. These dates are: date of last pregnancy, last livebirth, last fetal death, and last normal menses. These dates could be used to examine, for example, spacing of pregnancies or gestational age as related to maternal characteristics. For this reason, the consistency/reliability of these dates was analyzed using 1981 birth data.

NATALITY

THE LARGEST NUMBER OF MOTHERS TRAVELLED INTO A CITY FOR DELIVERY

In general, the availability of obstetrical services is greater in more populous areas. It is therefore not surprising that the proportion of mothers who travel for delivery is strongly dependent on size (population) of the city of residence. Nearly all (95 percent) of the mothers living outside of a city* travelled into a city for the birth, whereas very few (six percent) of the mothers living in a city of at least 100,000 population travelled to another city. If availability of services is a major determinant of travel for delivery, then the six percent figure for women in these major cities seems high. However, most of the travel was by women in two of the state's three major cities (Seattle and Tacoma) to neighboring cities and/or counties in the populous Puget Sound area. A very small proportion (0.2 percent) of the women living in the third major city, Spokane, went elsewhere, probably because of Spokane's relative isolation in the eastern part of the state. It is noteworthy that a significantly higher (but still small) proportion (four percent) of the mothers who travelled from the major cities had their babies in birthing centers.

The largest number of births is to women who travel from outside the city into a city for delivery (nearly half of the 1981 resident livebirths). The second largest group is composed of mothers who had the delivery in the city of residence (one-third of the 1981 livebirths). A small number of cases (<1 percent), graphed as "other," covered such cases as city dwellers having the baby outside of the city.

Given the relative frequency of travel for delivery, it is important to examine the characteristics and pregnancy outcome of these women in comparison with women who reside and deliver in the same area.

*A city is defined as having at least 2,500 population for purposes of this report.

NATALITY

ARE MOTHERS WHO TRAVEL HIGHER RISK THAN THOSE WHO DO NOT?

Mothers who travel outside their city of residence for delivery may need specialized services only available elsewhere; this may be especially true for women who travel to large cities (>100,000 population). These mothers would be referred to specialized services because they are at high risk for adverse pregnancy outcome. In order to investigate this possibility, five risk factors were defined.* These risk factors have been associated with high infant mortality, complications of pregnancy, low birthweight, or malformations.** Furthermore, a mother having multiple risk factors has a significantly higher chance of having a low birthweight infant, compared to a mother having one or no risk factors.*** The analysis presented here was confined to white singleton births in order to eliminate the confounding factors of race and multiple birth. White singleton births comprised 83 percent of the 1981 resident livebirths in Washington State.

The hypothesis that mothers who travel are higher risk is not confirmed by this multiple risk factor analysis. On the average, mothers who travel are lower risk in that a higher proportion belong to no risk categories, as defined here. This pattern was found regardless of the size of the city to which the mother travelled and regardless of whether the mother lived outside or inside the city. However, as the factors used here are undoubtedly not the only ones which define high risk, the relationship between travel and outcome still needs to be examined.

*Mothers younger than 18, unmarried mothers, mothers having previous fetal deaths, mothers having late or no prenatal care, certain age-parity combinations (older mothers having first child, younger mothers having other than first or second child).

**S. Taffel, "Factors Associated with Low Birthweight." Vital and Health Statistics Series 21, Number 37, DHEW Publication No. (PHS) 80-1915, National Center for Health Statistics, Hyattsville, Maryland, April 1980.

***1980 Washington State Vital Statistics Annual Summary, Washington State Department of Social and Health Services.

1981 WHITE SINGLETON RESIDENT LIVEBIRTHS—WASHINGTON STATE

TRAVEL FOR DELIVERY BY NUMBER OF RISK FACTORS

NATALITY

MOTHERS WHO TRAVEL TO LARGER CITIES HAVE SIGNIFICANTLY MORE LOW BIRTHWEIGHT INFANTS

There are three large cities (>100,000 population) in Washington State-- Seattle, Spokane, and Tacoma. These cities have a variety of services available to assist with complicated deliveries or high-risk infants. It is therefore not unexpected that mothers who travel to these cities, either from other cities or from outside the city, have a significantly higher proportion of low birthweight infants (birthweight < 2500 grams). A particularly high proportion of low birthweight infants was found for mothers having multiple risk factors and traveling from other cities to these large cities.

This strong relationship between birthweight and travel is remarkable in the absence of a positive relationship between travel and number of risk factors. These two patterns would be reconcilable if the low birthweight infants born to mothers who travel to large cities were relatively healthy (i.e., close to 2500 grams). In that case there would not be a substantially increased adverse outcome. However, when the distribution of very low birthweight infants (<1500 grams) is considered, a pattern similar to that described above is found. These results imply that there is some reason for many of these women to travel to a large city for delivery. Unfortunately, this reason cannot be found by studying the standard, easily measurable risk factors (e.g., age, marital status) used in many health planning and risk assessment efforts.

1981 WHITE SINGLETON RESIDENT LIVEBIRTHS—WASHINGTON STATE

TRAVEL FOR DELIVERY BY BIRTHWEIGHT AND NUMBER OF RISK FACTORS

NATALITY

CONSISTENCY OF DATES EXAMINED

The birth certificate has three dates related to previous pregnancies: date of last pregnancy, last livebirth, and last fetal death. Approximately half (51 percent) of the 1981 mothers reported a prior pregnancy. For 91 percent of these births, the date of the last pregnancy agreed with the date of either the last livebirth or the last fetal death. The remaining nine percent (3,222 births) were probably dates of prior induced abortions, but data were not available to check this hypothesis. Nearly one-third of the mothers reported that they had not been pregnant before the current birth. These women also reported no previous livebirth or fetal death in all but 0.03 percent of the births. For the remaining 16 percent of the births, at least one of the dates was missing (month or year or both).

In addition to being consistent with each other, dates must be consistent with other items on the birth certificate, e.g., if the date of the last pregnancy is given, the number of previous pregnancies should be at least one. These cross-checks, applied to total pregnancies, livebirths, and fetal deaths, showed that less than five percent of the records were inconsistent for any one item. (In this analysis, a date was considered valid if the year was given, even if the month was missing).

Within a given certificate, therefore, dates and numbers of events are relatively consistent. Whether or not these items are accurate cannot be addressed by currently available data.

1981 RESIDENT LIVEBIRTHS—WASHINGTON STATE

PREVIOUS PREGNANCY DATE CONSISTENCY

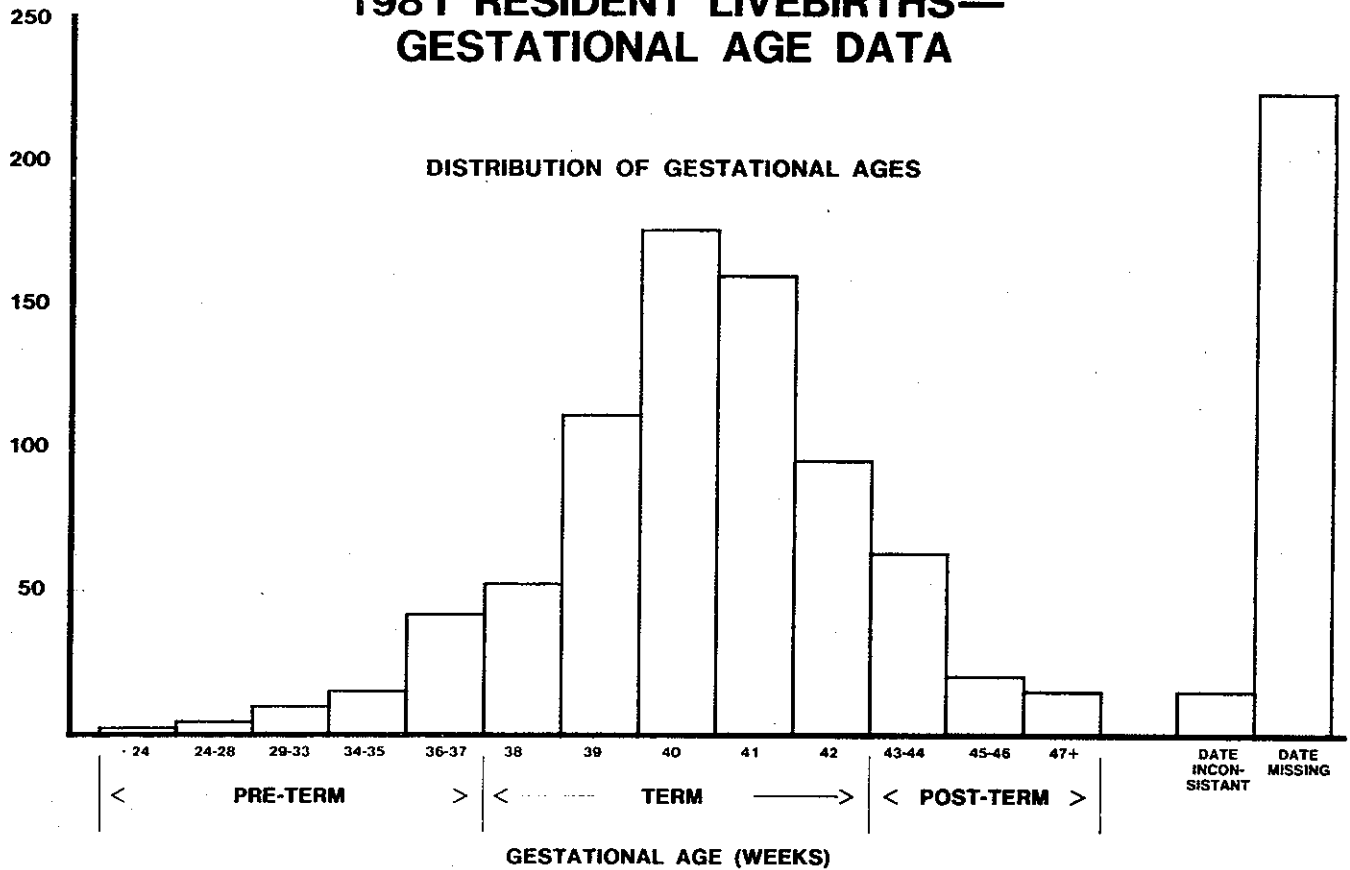

NATALITY

GESTATIONAL AGE CALCULATION REVEALS PROBLEM AREAS

Along with birthweight, gestational age is an important predictor of infant health. In fact, the two data items are strongly related to each other, with birthweight often being used for a rough approximation of gestational age. In 1981, most (78 percent) of the livebirths with a calculable gestational age were full-term (38-42 weeks). The distribution of gestational ages was skewed towards post-term infants, with nine percent being pre-term and 13 percent being post-term.

Comparison of gestational age with birthweight revealed that approximately one-quarter of the gestational ages were unreliable (inconsistent with birthweight, inconsistent or missing date of last normal menses). Of particular concern are the 15,617 births where date of last normal menses was missing. Most (91 percent) of these births had the month and year present, but the day was missing. These births showed a significantly larger proportion of low birthweight infants (6.6 percent, as compared to 4.9 percent for other births). These problems suggest that the data should not be used for any detailed planning purposes.

NATALITY

FURTHER ANALYSIS OF TRAVEL PATTERNS INDICATED

The most significant finding from this 1981 birth data analysis was that women travelling to large cities for delivery had substantially increased frequencies of low birthweight infants, but were not especially high-risk according to readily measurable characteristics. Birth certificate data should be examined in more detail to determine if some indication of a potential problem exists for these women. Of particular interest are medical conditions of the mother (either related or not related to the pregnancy) or other indications such as the performance of amniocentesis. The health of these infants, as revealed by their APGAR score and by infant mortality rates, should also be studied.

In view of the large number of inconsistent or missing gestational ages, problems with this item should also be investigated in more detail, with the aim of improving the data.

MORTALITY

PRESENTED THIS YEAR--YEARS OF LIFE LOST AND SELECTED DEATH RATES

Examination of cause-specific death rates has been used to determine where disease surveillance and intervention efforts should be placed. This procedure weights each death equally. An alternative method is to determine the years of life lost for each cause *. Using methodology presented by the Center for Disease Control,** it is assumed that each person should live to be 75 years of age; each year of age at death younger than 75 therefore represents one year of life lost. For example, a person dying at age 50 has lost 25 years of life. This procedure gives greater weight to causes (such as accidents) where people die relatively young; it may be useful for making decisions about the allocation of limited health care resources.

Trend data are also presented for causes in which there was a substantial change in the death rate between 1980 and 1981. Monitoring of these causes is necessary to avoid overlooking a potential health hazard (or a reduction in a health hazard).

*This analysis was suggested by researchers at the Office of Epidemiology, State of Washington Department of Social and Health Services.

**"Ten Leading Causes of Death in the United States, 1975". Center for Disease Control, Bureau of State Services, Health Analysis and Planning for Preventive Services, Atlanta, Georgia 30333.

MORTALITY

IN 1981, WASHINGTON STATE RESIDENTS LOST 344,485 YEARS OF LIFE DUE TO "PREMATURE" DEATH

The 344,485 years lost in 1981 represents, on the average, 10.8 years lost for each death. Because different causes affect different age groups, the cause of death plays a large role in determining the number of years lost. For example, deaths due to circulatory system diseases account for nearly half (47.5 percent) of the 1981 resident deaths, but only 21 percent of the years of life lost. On the other hand, deaths due to injury and poisoning account for less than 10 percent of the deaths, but 29 percent of the years of life lost. Obviously, infant deaths have the greatest relative number of years lost; this fact is implicitly recognized by the importance given to reducing infant mortality rates.

On the average, a female death results in fewer years lost (8.4, as compared to 12.8 years for a male death). The distribution of years lost by cause is also different for men and women; in terms of numbers, the most important cause is neoplasms for women and injury and poisoning for men.

Each of these cause of death categories is too broad to be useful for surveillance and intervention programs; more specific categories need to be examined, especially for the three leading causes (injury and poisoning, circulatory system disorders, and neoplasm), which account for 70 percent of the years of life lost.

*A detailed table showing the distributions of deaths and years of life lost for various causes is given in the Appendix. ICDA codes for the various causes are also listed on this table.

1981 RESIDENT DEATHS YEARS OF LIFE LOST

MORTALITY

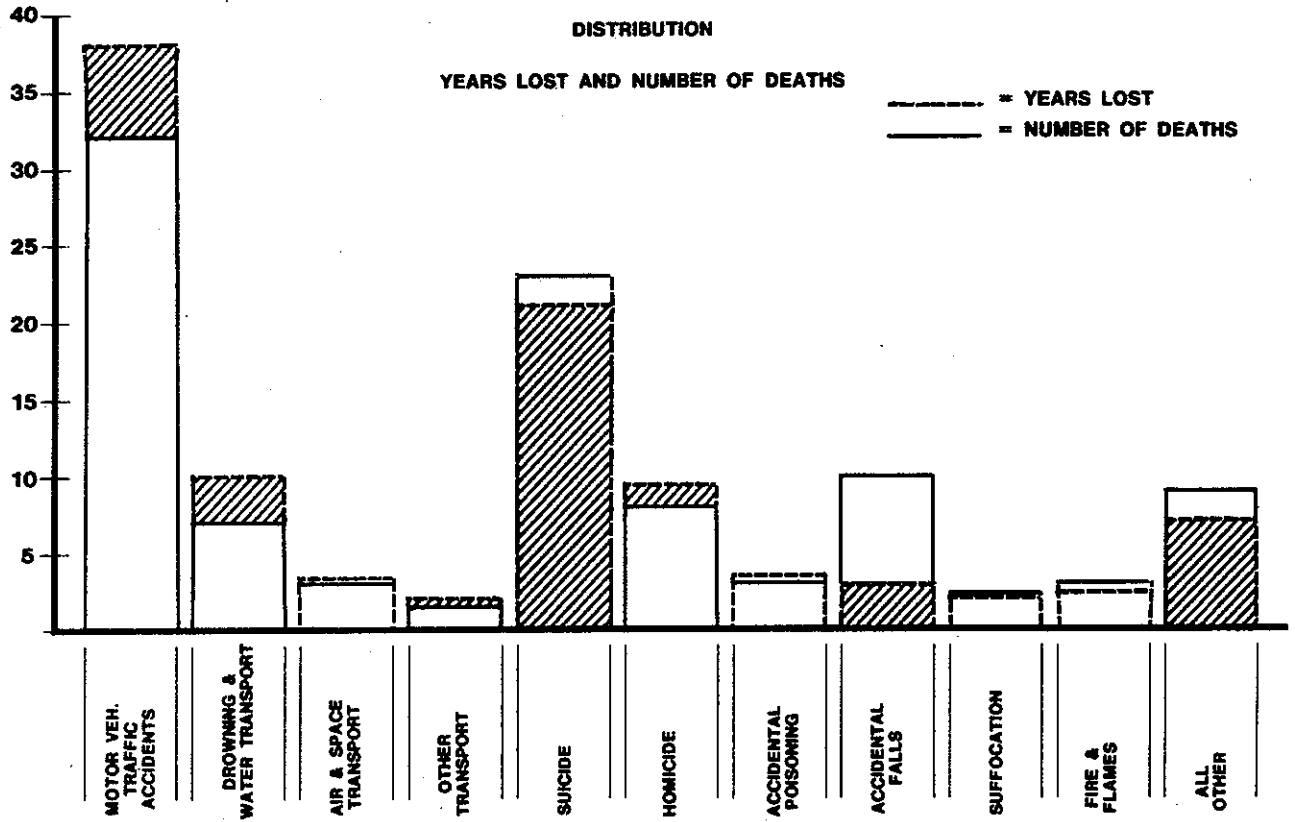

MOTOR VEHICLE TRAFFIC ACCIDENTS AND SUICIDE ARE LARGEST CONTRIBUTORS TO INJURY AND POISONING DEATHS

As a group, injury and poisoning deaths are the largest cause of years lost for men and the second largest cause for women.

More than half of the years of life lost (and deaths) in this classification are due to motor vehicle traffic accidents or suicide. Even though there were less than 2,000 deaths from these two causes in 1981, the number of years lost was nearly the same as the number of years lost from the 11,287 heart disease deaths.

1981 RESIDENT DEATHS — INJURY AND POISONING

PERCENT OF INJURY & POISONING DEATHS

PERCENT

MORTALITY

HEART DISEASE STILL NUMBER ONE

Most of the deaths from circulatory system diseases are due to heart disease. Although the total number of years lost is greater for other groups than for circulatory system diseases, heart disease deaths are still the largest single cause of years of life lost, primarily because of the large number of heart disease deaths. On the average, the number of years lost per death (5.3) is small, compared to the number of years lost for a death from injury or poisoning (35.6) or malignant neoplasm (9.6).

1981 RESIDENT DEATHS— CIRCULATORY SYSTEM

**DISTRIBUTION—YEARS LOST AND
NUMBER OF DEATHS**

SEX DISTRIBUTION

MORTALITY

LARGE RELATIVE NUMBER OF FEMALE LIVES LOST FROM MALIGNANT NEOPLASM

As a group, neoplasms (cancer) are the leading cause of years of life lost for women, but are only the third most important cause for men. There is no difference between women and men in terms of the average number of years lost per cancer death (9.7 for women and 9.5 for men). The relative importance of cancer in the distribution of years lost for women thus appears to be a result of lower numbers of deaths and years lost from other causes.

As expected, breast cancer is a relatively important cause of years lost for women; however, among cancer deaths it is a close second to cancer of the respiratory and interthoracic organs. In fact, if deaths from breast cancer were eliminated, malignant neoplasms would still be the leading cause of years lost for women.

1981 RESIDENT DEATHS — NEOPLASM (CANCER)

MORTALITY

LARGE CHANGE IN MOTOR VEHICLE ACCIDENT AND SUICIDE DEATH RATES

In 1981, as in the past, heart disease, cancer, and cerebrovascular disease were the three leading causes of death among Washington State residents. Death rates from these causes decreased slightly between 1980 and 1981, a continuation of the trend seen over the past decade for heart disease and cerebrovascular disease and over the past four years for cancer.*

Accident death rates decreased by 10.5 percent between 1980 and 1981, mostly because of the reduction in deaths due to motor vehicle accidents (18.3 percent decrease). Between 1979 and 1980, motor vehicle accident death rates also decreased (by 8.7 percent), for a net decrease of 27.0 percent over the past two years. One reason for this substantial decrease may be that people are driving less due to high gasoline prices and bad economic conditions. However, this explanation would not account for the fact that, for Washington State, the death rate per 100,000,000 vehicle mile also decreased, from 3.4 in 1980 to 3.0 in 1981.**

Of great concern is the 11.9 percent increase in the suicide rate between 1980 and 1981. This increase reverses the pattern, begun in 1974, of steadily declining suicide rates in Washington State. The high unemployment rates in the Northwest could have contributed to this increased rate. In contrast, the U.S. rates*** decreased between 1980 and 1981 for all but the youngest age groups (15-34).

*1970-80 death rates for Washington and the U.S. were graphed in the 1980 Vital Statistics Annual Summary.

**Accident Facts: 1982 Edition (Published by National Safety Council, 444 North Michigan Avenue, Chicago, Illinois 60011).

***Annual Summary of Births, Deaths, Marriages, and Divorces: United States, 1981. NCHS Monthly Vital Statistics Report, Vol. 30, No. 13, December 20, 1982.

MORTALITY

OUTCOME OF YEARS OF LIFE LOST AND DEATH RATE ANALYSES

Studying years of life lost in conjunction with the number of deaths reveals three causes of death which have a large impact on the state's mortality and consequently where intervention strategies would be desirable.

1. Accidental and suicide deaths, where people die relatively young, but the overall number of deaths is small. In this case, preventing a few deaths results in a relatively large decrease in the number of years of life lost. Since lifestyle contributes to the majority* of accidental and suicide deaths, emphasis should be placed on lifestyle changes, possibly through education and/or counseling.
2. Heart disease deaths, where the mean age at death is fairly old, but the total number of deaths is large. In this case, extending the average life span of heart disease patients, either through medication or lifestyle changes, would result in a large number of years of life saved.
3. Cancer, which presents a pattern intermediate between the two. Lifestyle, environment, and biology contribute almost equally to cancer deaths.* In this case, it is difficult to devise a single intervention strategy, as 'cancer' is such a multi-faceted entity.

It must be emphasized that the years of life lost concept is only one way of looking at mortality data. While ways can be found to minimize the number of years of life lost, the available data cannot describe the quality of the years that are saved.

In terms of cause-specific death rates, the most significant finding in 1981 was the high suicide rate. Given that Washington State has generally had higher suicide rates than the U.S. as a whole, the large increase in Washington's suicide rate is cause for concern, particularly if the rate remains high in subsequent years. Age-specific data point to a particular problem in the 35-64 year age groups.

*"Ten Leading Causes of Death in the United States, 1975," Center for Disease Control, Bureau of State Services, Health Analysis and Planning for Preventive Services, Atlanta, Georgia 30333.

APPENDIX TABLE

YEARS OF LIFE LOST--BY CAUSE AND SEX
1981 Resident deaths, Washington State

CAUSE (ICDA Code, Ninth Revision)	Number of Deaths	Total	Years of Life Lost	
			Female	Male
*External causes--injury and poisoning	2,784	99,003	25,299	73,704
Motor vehicle traffic accident (810-819,9290)	893	37,163	10,851	26,312
Drowning and water transport (830-838,910)	199	9,402	1,383	8,019

FETAL MORTALITY BY CAUSE, WASHINGTON STATE, 1981

Cause with International List Number	Number
TOTAL ALL CAUSES	489
Congenital Anomalies	38
Anencephalus (740)	17
Spina Bifida (741)	2
Hydrocephalus and Encephalomyelocele (742)	1
Anomalies of the Heart (746)	4
Anomalies of Respiratory System (748)	1
Anomalies of Digestive System (750-751)	0
Anomalies of Musculoskeletal System (755-756)	0
Chromosomal Anomalies (758)	2
Other and Unspecified Congenital Anomalies (747,749,752-754,759)	11
Certain Causes of Perinatal Morbidity and Mortality (760-779)	448
Maternal Conditions Which May be Unrelated to Pregnancy (760)	16
Chronic Hypertension (7600)	9
Maternal Infections (7602)	2
Maternal Injury (7605)	3
Other Maternal Conditions (7603-7604, 7606-7609)	2
Maternal Conditions Related to Pregnancy (761)	30
Incompetent cervix (7610)	6
Premature rupture of membranes (7611)	18
Other Maternal Conditions (7612-7619)	6
Complications of Placenta, Cord, and Membranes (762)	194
Complications of Placenta (7620)-7623)	104
Complications of Cord (7624-7626)	81
Complications of Membranes (7627-7629)	9
Difficulties of Labor (763)	8
Intrauterine Hypoxia (768)	21
Other Complications of Pregnancy and Childbirth (764-765)	25
Disease of the Fetus and Ill-defined Causes (770-779)	154
Respiratory Conditions (770)	1
Infections Specific to the Perinatal Period (771)	2
Fetal Hemorrhage (772)	1
Haemolytic Disease (773)	4
Infant of Diabetic Mother (7750)	6
Other Conditions of Fetus (776-779)	140
All Other Causes (001-739,780-799)	3

APPENDIX

APPENDIX A

BACKGROUND

RELIABILITY OF THE DATA

In analyzing any data, the possibility of errors in the data must not be overlooked. There are several types of possible errors, including under-registration, errors made by the informant, and errors in compilation and processing. The most potentially dangerous error, however, is probably that of improper interpretation.

Statistics are neither more true nor false than the interpretation given to them. It should be emphasized that most of the rates computed in this report are crude rates. For comparing geographic areas, crude rates are limited. They do not reflect differences in age, sex, race, and other population characteristics. In addition, it is important to recognize the possible distortion in these rates where the number of events or the population is small. Minor variations in the number of events may result in major changes in the rates. Special caution should also be exercised in analyzing trend data, because of changes throughout the years in medical diagnosis, coding definitions, and registration coverage.

POPULATION

Population data in this report are an estimate of population, April 1, 1981, provided by the Office of Financial Management.

RATES

Rates are calculated by dividing the event of concern by the population at risk or a related population and multiplying by a constant. Death rates from all causes and livebirths are expressed in terms of 1,000 estimated population; deaths from a specific cause are based on 100,000 estimated population (excluding maternal and infant causes); maternal deaths are calculated per 10,000 livebirths; infant, neonatal and fetal deaths are calculated per 1,000 livebirths.

CAUSE OF DEATH CLASSIFICATION

The cause of death presented herein are classified in accordance with the Ninth Revision of the International Classification of Diseases, which the State of Washington began using January 1, 1979.

RATES AND WHOLE NUMBERS

Rates are rounded to the nearest tenth. When the rate or percent is less than one-tenth, the entry is 0.

When whole numbers are used, a blank or dash (-) indicates none or zero.

APPENDIX B
DEFINITIONS

GENERAL TERMS

BIRTH WEIGHT - Weight of fetus or infant at time of delivery (normally recorded in pounds and ounces).

FETAL DEATH - Death prior to the complete expulsion or extraction from its mother of a product of human conception, irrespective of the duration of pregnancy; the death is indicated by the fact that after such expulsion or extraction the fetus does not breathe or show any other evidence of life such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles.

GESTATIONAL PERIOD - Number of weeks elapsed between the first day of the last menstrual period and date of delivery.

INFANT DEATH - Death of an infant under one year of age.

LIVE BIRTH - The complete expulsion or extraction from its mother of a product of human conception, irrespective of the duration of pregnancy, which, after such expulsion or extraction, breathes, or shows any other evidence of life such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles, whether or not the umbilical cord has been cut or the placenta is attached.

LIVE BIRTH ORDER - Order number is equal to number of previous live births plus current birth.

MATERNAL DEATH - Death attributable to complications of pregnancy, childbirth, or the puerperium.

NEONATAL DEATH - Death of an infant within the first 27 days of life.

OCCURRENCE DATA - Data allocated by place where event occurred, regardless of the person's place of residence.

PERINATAL DEATH - Includes stillbirths and deaths to infants within the first six days of life.

PREMATURE BIRTH - A live birth weighing 2,500 grams (5-1/2 pounds) or less. If birth weight is not stated, length of gestation (under 37 weeks) is used.

RESIDENCE DATA - Data allocated by place of residence of the decedent (deaths), or by place of residence of the child's mother (births, stillbirths).

RATES

AGE-SPECIFIC DEATH RATE - Number of deaths in a specific age group per 100,000 population in that age group.

CAUSE-SPECIFIC DEATH RATE - Number of deaths from a specific cause per 100,000 population.

(CRUDE) BIRTH RATE - Number of live births per 1,000 population.

(CRUDE) DEATH RATE - Number of deaths per 1,000 population.

FERTILITY RATE - Number of live births per 1,000 women 15-44 years of age.

FETAL DEATH RATE - Number of stillbirths per 1,000 live births.

INFANT DEATH RATE - Number of infant deaths per 1,000 live births.

MATERNAL DEATH RATE - Number of maternal deaths per 10,000 live births.

NEONATAL DEATH RATE - Number of neonatal deaths per 1,000 live births.

PERINATAL DEATH RATE - Number of perinatal deaths per 1,000 live births, plus fetal deaths.

APPENDIX C

CONVERSION OF BIRTHWEIGHT GROUPS IN GRAMS
TO POUNDS AND OUNCES

GRAMWEIGHT	POUNDS AND OUNCES
1,000 grams and under	2 lbs. 3 oz. and less
1,001 - 1,500	2 lbs. 4 oz. - 3 lbs. 4 oz.
1,501 - 2,000	3 lbs. 5 oz. - 4 lbs. 6 oz.
2,001 - 2,500	4 lbs. 7 oz. - 5 lbs. 8 oz.
2,501 - 3,000	5 lbs. 9 oz. - 6 lbs. 9 oz.
3,001 - 3,500	6 lbs. 10 oz. - 7 lbs. 11 oz.
3,501 - 4,000	7 lbs. 12 oz. - 8 lbs. 13 oz.
4,001 - 4,500	8 lbs. 14 oz. - 9 lbs. 14 oz.
4,501 grams and over	9 lbs. 15 oz. and over

One pound = 453.59 grams

APPENDIX D

POPULATION OF THE STATE OF WASHINGTON
BY AGE GROUP, BY SEX, APRIL 1, 1981

AGE GROUP	TOTAL	MALE	FEMALE
TOTAL	4,250,123	2,113,414	2,136,709
Under 1 Yr.	68,424	35,053	33,371
1 - 4	254,201	130,031	124,169
5 - 14	624,704	320,028	304,676
15 - 24	770,387	396,870	373,517
25 - 34	787,107	397,690	389,417
35 - 44	513,631	260,547	253,084
45 - 54	396,153	197,711	198,442
55 - 64	389,276	187,543	201,734
65 - 74	273,015	124,795	148,220
75 - 84	132,171	50,790	81,380
85 and over	41,054	12,356	28,699

APPENDIX E

POPULATION, STATE OF WASHINGTON, COUNTIES AND
CITIES OF 10,000 POPULATION AND OVER, APRIL 1, 1981

Adams		13,100	Kittitas		25,100
Asotin		17,000	Ellensburg	11,900	
Benton		113,400	Klickitat		16,200
Kennewick	34,700		Lewis		56,700
Richland	33,700		Centralia	12,000	
Chelan		46,200	Lincoln		9,600
Wenatchee	17,300		Mason		31,900
Clallam		52,500	Okanogan		30,900
Port Angeles	17,300		Pacific		17,800
Clark		195,800	Pend Oreille		8,800
Vancouver	42,600		Pierce		501,300
Columbia		4,000	Puyallup	18,200	
Cowlitz		80,500	Tacoma	159,800	
Kelso	11,150		San Juan		8,100
Longview	31,100		Skagit		64,900
Douglas		22,800	Mt. Vernon	13,300	
Ferry		6,000	Skamania		8,100
Franklin		36,700	Snohomish		353,400
Pasco	18,700		Edmonds	28,300	
Garfield		2,400	Everett	56,000	
Grant		48,600	Lynnwood	23,700	
Moses Lake	10,400		Mountlake Terrace	16,200	
Grays Harbor		66,800	Spokane		347,600
Aberdeen	18,700		Spokane (city)	171,200	
Island		45,200	Stevens		29,500
Oak Harbor	12,317		Thurston		129,100
Jefferson		16,600	Lacey	14,200	
King		1,309,723	Olympia	27,600	
Auburn	27,800		Wahkiakum		3,800
Bellevue	75,500		Walla Walla		47,900
Kent	23,400		Walla Walla (city)	25,400	
Kirkland	19,000		Whatcom		109,900
